Hi Cheryl,

Spoke with Ken this morning. He is on board to speak at the meeting and excited to show the EPA his land. Below is a list of the chemicals that were dumped by GP on his land. Can you send these to Tony or Wilma and see which chemicals, or all, that we can test for? And can you please help us find out how much it would cost?

**1. Tall Oil:** 6,000 – 8,000 gallons were dumped on his land from the GP Chemical Plant

**2. Boiler Ash:** dumped for many years on his land from the GP Plywood plant.

**3. Cresote:** This chemical is from the GP Plywood plant. According to Ken this is what is used in light pools and cross ties. (Off initial research I read that this is toxic and has carcinogenic properties).

**4. Acid:** Yellow-green acid that foamed was dumped on his land.

Thanks so much!

Natalie
